

Please read this before using the STOS Compiler

The disc in this box contains the very latest version of STOS Basic: Version 2.5 which makes STOS compatible with the new Atari STE range – so please ignore all references to Version 2.4 in the Compiler manual.

This means that you will need to update your STOS Basic Language disc if you have Version 2.4 or earlier. The procedure to do this varies slightly from that described in the manual. Simply follow the on-screen prompts to install Version 2.5 correctly.

The Compiler itself has also been updated, ironing out various minor bugs that have been reported to us by existing STOS users.

Please ensure that you return the enclosed registration card so we can provide you with technical support should you need it. We do recommend that you join the STOS Club to keep up-to-date with possible future updates – you will find full details in this package.
